

Health & Safety Training

Professional Experienced Trainers

EnSafe Inc.'s professional trainers have more than 40 years' experience in developing and conducting safety and health training programs. Our diverse client base ranges from a variety of industrial sectors to government contractors.

Customized Training Material

Most other companies use generic training programs that meet the applicable regulatory training requirements. EnSafe's approach, however, is to customize the training material to address the specific concerns of a particular facility or group. The use of customized training material provides the student with a familiar environment in which to apply the material presented in the course.

Prior to conducting a training course for a client, EnSafe personnel review material safety data sheets, process technology, facility layout, and existing company standard operating procedures. This information is used to modify the existing course material in order to closely mirror the materials, equipment, and conditions the student will encounter in his or her workplace.

Practice Brings Theory to Life!

EnSafe makes extensive use of tabletop exercises to provide immediate feedback of presented material, as well as field-oriented practical exercise drills designed to simulate actual workplace conditions and situations.

The end result is a safety training experience that is informative, applicable, entertaining, and most importantly, effective.
